

« Altitude » a comprehensive database on all new DT cases in France

Previous DT scientific meetings have shown the necessity of setting up a comprehensive and reliable database on DTs : hence this new project to be started in 2016 :

*« Altitude » a comprehensive database on all new DT cases in France* will cover both clinical and biological data for somatic DTs and Familial Adenomatous Polyposis patients as well. Being created on a prospective basis and fed by the two labelled networks (clinical , and pathological) it should provide highly reliable information. It will involve 32 hospital centres, including 12 pediatric departments. According to the protocol, the patients will be go through a systematic follow-up as long as they accept it. This follow-up will include quality of life and pain factors. The project will be led by Dr Nicolas Penel (Centre Oscar Lambret, Lille).

This project was chosen following an invitation to submit projects issued by the Ligue nationale contre le cancer and funded by a private donation through fondation Curie.
