The French Patient Registry Project

Nicholas Penel, MD, PhD, Medical Oncology, Centre Oscar Lambret

Since 2010, the French National Cancer Institute have labeled Reference Centers for management of Desmoid Tumours. These centers treat about 50% of incident cases of desmoid tumours. These centers currently run 2 clinical trials: a wait and see policy prospective trial and a randomized trial assessing the activity methotrexate+vinblastine versus pazopanib in relapsing/progressing desmoid tumours.

However, the available data about natural history, activity of treatment, relationship with FAP, role of pregnancy in desmoid tumours are sparse and biased because coming from retrospective database. Our aim is to launch a large nationwide prospective database with virtual tumour bank and serum collection to better describe and understand the course of desmoid tumour.
